

Pamoja

The fan companion app for the **PAMOJA Pass** at AFCON 2027 — one digital pass used across Kenya, Uganda and Tanzania for match access, travel and city services. This brief asks for a **mobile and desktop redesign** with usability and navigation as the priority.

What already works and must survive: the two-hue palette, Outfit + JetBrains Mono, the Mount Kenya media motif, and the product's rule that Pamoja *never holds a fan's money*. Everything below the "Problems" heading is open.

What the app is

A React Native / Expo app (iOS, Android, and a static web export) running entirely on mock data — no backend. A fixed demo clock puts the fan mid-tournament: Wed 23 June 2027, 12:55 EAT, standing in Kasarani, Nairobi, holding an active Pass.

THING	WHAT IT IS
The Pass	The credential. Identity, entitlements, validity. Rendered from local state only — never a network call.
The record	An append-only list of discounts claimed. Held on the device. Drives every "you've saved" figure.
The ticket	A seat, distinct from the credential. Category, gate, section, seat.
Partners	2,189 businesses giving Pass holders a discount, in six categories.
Fixtures	11 seeded matches across three countries and six venues.

Design system as it stands

deep #04222b	deep-soft #223c44	accent #0e6ba8	accent-tint #e2edf4	ink #16181a	body #4a565b
hairline #dde3e4	panel #eef0f0	surface #f5f8f8			

Two hues only — deep and accent — sampled from the proposal artwork and matching the Uratibu brand guideline exactly (Forest, Command Cerulean, Tint, Paper, Ink). There is no per-category or per-status colour coding. Where something has tiers, tier is shown as *depth of the one accent* (100% / 55% / 25%); a disabled or sold-out state leaves the hue entirely for panel.

Type. Outfit carries voice; JetBrains Mono carries anything procedural — codes, amounts, record lines, timestamps, pass numbers — uppercased for eyebrows. The split is the point: a glance tells narrative text from data you might read aloud, type in, or match against a physical document. Families are addressed by

semantic key (font-sans, font-medium, font-display, font-display-heavy, font-mono, font-mono-medium), never by weight utility.

Shape and motif. Cards use a 10px radius. All media is cropped to **Mount Kenya's split summit** — Batian, the Gate of the Mists, Nelion — from one geometry table, which also produces the Explore tab icon. Media only: cards, chips and panels stay rectangular.

Screens today — 15 in total

SCREEN	TAB	WHAT'S ON IT
Home	Home	Greeting + avatar, next fixture card, savings money-box with sparkline, nearest offers.
Explore	Explore	Search across fixtures/venues/offers, 4 filter pills, this week's fixtures, events, offers by category.
Live	Live	Live score, match stats trio, also-live list, next-up.
Services	Services	6 service tiles, a Getting-there row, "2,189 partner businesses", 6 category tiles.
Pass	Pass	The Pass card, what it unlocks, the match ticket, a wallet row.
Wallet	Pass ›	Saved/spent figures, savings-rate donut, week chip, the record grouped by day.
Getting there	Services ›	Drive/Fly toggle, Arriving/Leaving toggle, up to 5 route pills, route strip, stats, cost estimate, documents, good-to-know, caveat, last-leg band.
Ticket office	Explore ›	Hall map of Talanta's bowl, tier legend, block selection, seat stepper, total, hand-off.
Category	Services ›	Partners in one category.
Partner	Explore/Home/Services ›	Discount, merchant code, two redeem routes.
Scan	Services ›	Enter the merchant's code.
Confirm	Explore/Home/Services ›	Bill amount, discount maths, write one record line.
Parking	Services ›	Zones A–D with walk minutes.
Safety	Services ›	Steward help line, report a problem.
Issuance	—	3-step Pass creation. The only screen with no tab bar.

Navigation model

5 tabs, each owning its own stack – a pushed screen stays under the tab bar.

Home — Partner — Confirm
Explore — Partner — Confirm — TicketOffice
Live
Services — Category — Partner — Confirm — Scan — Parking — Safety — GettingThere
Pass — Wallet

Above all five: Issuance, shown only when no Pass exists.

Screens reachable from more than one tab are registered in each of those stacks, so every tab keeps its own history. Back is a circular chevron at the top-left, which hides itself at a stack root. **Verified sound:** the tab bar is present on all 15 screens and back works on every pushed screen.

Layout today

VIEWPORT	WHAT HAPPENS
Phone	Single column, tab bar across the bottom.
< 1024px on web	The app is framed in a 440px phone-width column on a neutral backdrop.
≥ 1024px	Tabs become a 96px rail down the left; content sits in a 640px centred column.

Problems to solve — evidence, not opinion

1. Seven of eleven fixtures cannot be reached. Explore is the app's only fixture list, and it is capped to a seven-day window *and* five rows. Home shows one fixture; Live shows what is live or next. There is no full schedule anywhere. A fan cannot see who plays next week, and a match dated outside the window is invisible app-wide — this was discovered when a fixture had to be re-dated to make its own ticket office reachable at all.

2. Assistive-tech roles — fixed 19 Aug 2026, no design needed. Eleven of the app's fifteen pressables had no `accessibilityRole`, so every interactive row, tile and pill was announced as plain content: a screen with twelve controls reported one. Roles and selected/disabled states are now in place (measured 1 → 12 on Getting there). What is *still* a design question is the **visible** side: focus rings and pressed states are currently opacity changes only.

3. Getting there stacks three rows of chrome before content. Drive/Fly, then Arriving/Leaving, then up to five route pills. Three decisions before the fan sees a single fact, and two of the three are modal.

4. Services is a grab-bag. Six service tiles, a getting-there row, a partner count, and six category tiles on one screen — transport, food, lodging, safety, retail and cross-border travel under one word.

5. Desktop is a phone in a column. The rail works, but nothing reflows: no screen uses more than one column, so a 1440px viewport shows the same single-file list a 390px phone does.

6. Affordances are inconsistent. One fixture row opens a ticket office; the other three look identical and do nothing. The office is reachable from exactly one place in the app.

What to design

Mobile

- An information architecture that exposes **the whole schedule**, and a route from any fixture to what a fan can do about it — travel, tickets, the ground.
- A better answer than three stacked toggles for "how do I get to a match", covering road and air, in and out of Nairobi.
- A split or restructure of Services that separates matchday logistics from the 2,189-partner discount network.
- Visible focus rings and pressed states for every control — the semantics are now correct, the visual feedback is still just an opacity change.

Desktop

- A layout that earns its width: multi-column where content is list-like, and a persistent secondary pane where a fan is comparing things (routes, blocks, offers).
- A place for the rail to carry more than five words.

The agreed target design

Brainstormed 19 August 2026. The three decisions below are settled; the visual design of them is what this brief is asking for.

1. The match is the spine

Almost everything a fan does hangs off a specific fixture — where it is, how to get there, tickets, parking, the ground. Today the fixture is a row buried under a search box and the things attached to it are scattered across three tabs. A **Matches** tab holds the full schedule; tapping a fixture opens **one screen that composes everything about it**:

MATCH DETAIL

TeamRow (flags + names) · kickoff · venue AND city
State scheduled → live (score, stats) → full-time [absorbs the Live tab]
Getting there . road + air legs to THIS city, with cost estimates
Tickets hall map + block picker, where a map exists
At the ground . parking zones + walk times, safety, shuttles
Your ticket ... if the Pass carries one for this match

2. Four tabs

TAB	HOLDS
Home	Today: a live match if one is live, the next fixture, savings, offers near you, and the arriving-in-Kenya travel guide.
Matches	The full schedule, grouped by day. Row chips: LIVE / TICKETS / FLY / IN N DAYS. Leads to match detail.
Offers	The 2,189-partner network: search, six categories, nearby, and the redemption flow.
Pass	The credential, what it unlocks, the match ticket, and the record.

Live stops being a tab — it is dead most of the tournament — and becomes a state of a match. **Services**

splits: matchday logistics attach to the match they belong to, and the discount network becomes Offers, which is what fans actually go looking for.

3. Desktop is two-pane master/detail

+-----+-----+-----+-----+			
rail	MATCHES	Kenya v Mali	
Home	> Sat 26 Jun	Kasarani, Nairobi	
Match	Mon 28 Jun	Gates open 14:00	
Offer	Tue 29 Jun	Getting there / Tickets	
Pass	Wed 30 Jun	At the ground	
+-----+-----+-----+-----+			

Almost every screen in this app is a list that leads to a detail, so the list and the detail should be visible together above 1024px: schedule beside a match, offers beside a partner, the Pass beside its record. Home stays a single wide surface, but multi-column.

Where today's 15 screens go

TODAY	BECOMES
Home	Home — plus a loud live-match entry and the arriving-in-Kenya guide
Explore	Splits: fixtures → Matches, offers → Offers, events → Home
Live	The live state of a match detail
Services	Splits: logistics → match detail sections, partners → Offers
Pass, Wallet	Pass, Pass › Wallet (unchanged)
Getting there	Per-match travel → match detail; arriving in Kenya → Home ›
Ticket office	Match detail › (or a section within it)
Category, Partner, Scan, Confirm	Offers › (the redemption flow, unchanged)
Parking, Safety	Match detail sections
Issuance	Unchanged — the only screen with no tab bar

Two tensions this creates, to design around

- Live needs a one-tap path.** Folding it into a match is right, but during a match a fan must not have to go Matches → find the fixture → scroll. Home has to surface a live match loudly and lead straight to it.
- Inbound travel is not match-specific.** "Arriving in Kenya from Uganda" belongs to a fan, not a fixture. Per-match travel lives in the detail; the arriving guide needs its own home off Home or it is orphaned.

Non-negotiables

- No payment, ever.** Pamoja never holds funds, never sees a card number, needs no banking licence. Money flows are hand-offs: the fan pays the merchant, the seller, or the airline directly.

- **Two hues.** No third brand colour, no per-category or per-status colour coding.
- **Outfit and JetBrains Mono**, addressed by semantic key.
- **No invented data presented as fact.** Prices, fares, schedules and entry requirements carry an "as of" date and a confirm-before-you-travel caveat, or are labelled prototype figures. Nothing may imply a precision it does not have.
- **The record is local.** No dashboard anywhere assembles a view of a fan.

Pamoja design brief · generated 19 August 2026 · palette, type and motif taken from DESIGN.md · problems 1, 2 and 5 verified by driving the built app in a browser at 420×1000 and 1440×900
